Items

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
1	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19 — CONST-046 i18n architecture design; Option D (nicksnyder/go-i18n/v2)
2	High	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#1 — pkg/i18n core foundation Bundle/Localizer + sentinel errors
3	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#10 — This task added translated texts shown in the command-line tool for those brief descriptions can eventually be instead of being locked to English.
4	Medium	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#11 — challenges/pkg/i18n, evaluators.go migration
5	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#12 — challenges/pkg/user challenge_recorded_ai_testgen.go × 10 of .

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
6	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#13 — challenges/pkg/user migration
7	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#14 — challenges/pkg/user user-facing migration
8	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#15 — challenges/pkg/user challenge_recorded_mobile.go × 7 unique
9	—	Completed (→ Fixed.md)	Task	—	FIX-2026-05-19#16 — CONST-046 i18n imp doc
10	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#17 — This task added the the project's tracking document into easy-PDF files, using standard document-conve for team members and stakeholders to re needing to open raw text files.
11	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#18 — helix_code/cmd/heli
12	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#19 — This task began the (translation) support to the helix_qa testing component, so any text it shows to users o other languages instead of only English.
13	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#2 — CONST-046 audit scri scan 57,345 violations across 21,937 files
14	—	Completed (→ Fixed.md)	Task	—	FIX-2026-05-19#20 — CONST-052 rename (HXC-001 plan, ex-ISSUE-005)
15	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#21 — This task started add the LLMOrchestrator component, which o several different AI language models. A h error messages were converted into a tra
16	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#22 — This task began con line text shown by the LLMsVerifier tool (model providers) into a translatable form multiple languages. Only a small number tool were converted in this first pass.
17	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#23 — This task started add HelixSpecifier tool so that its user-facing t languages other than English.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
18	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#24 — This task started adding the Storage component of the system, which is responsible for retrieving data, so its messages can eventually be translated into multiple languages.
19	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#25 — This task started adding the LLMOps component, which manages the different language models the system relies on, so its messages can be shown in multiple languages.
20	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#26 — This task started adding the VectorDB component, which is the database for storing specialized AI-related data, so its messages can be translated into multiple languages.
21	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#27 — This task started adding the Observability component, the part of the system responsible for health and performance, so its messages can be translated into multiple languages.
22	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#28 — This task added translation for the error module, the part of the system that connects to external services, hardcoded English error and status messages, converting them to a translatable format, fully completing this task and leaving nothing left over.
23	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#29 — This task added translation for the logging component, converting five hardcoded English messages to a translatable format so the messaging system can support different languages for users.
24	Medium	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#3 — This task built the unified interface, an individual sub-component of the system responsible for presenting the system, including a working example already implemented in Serbian. This lays the groundwork so future tasks can focus on remaining user-facing text across the whole system.
25	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#30 — This task added translation for the Middleware component, converting three hardcoded English messages about authentication and rate-limiting to a translatable format.
26	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#31 — This task added translation for the API component, the part of the system that handles external requests.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					converting five hardcoded messages about sandboxing into a translatable format.
27	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#32 — This task added translation component, which handles live, real-time converting five hardcoded connection-related messages into a translatable format.
28	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#33 — This task added the groundwork to the Watcher component, which handles file and event changes. This was a behind-the-scenes component's outward labels are internal labels that are directly read.
29	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#34 — This task started adding a new conversation component, which manages conversations with users, so its messages can eventually be translated.
30	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#35 — This task added translation component, the part of the system that manages converting nine hardcoded status and error messages into a translatable format and reducing the number of remaining messages in that area from 73 to 64.
31	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#36 — This task added translation component's privilege-check feature, converting warning and description messages into a translatable format and reducing the untranslated messages to 10.
32	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#37 — helix_code/cmd/cli/round 24)
33	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#38 — This task started adding an AutoTemp component so its messages can be translated into multiple languages.
34	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#39 — This task started adding a new Auth (login and authentication) component, which can be shown in multiple languages.
35	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#40 — This task converted error templates used by the SelfImprove component into a translatable format, asking the AI model to review and improve the messages into a translatable format.
36	Low		Feature	—	

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
		Implemented (→ Fixed.md)			FIX-2026-05-19#40 — helix_code/cmd/serv 4 round 27)
37	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#41 — This task added the groundwork, including 36 translation ent PliniusCommon library, so that any text it and can safely support many people using
38	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#42 — helix_code/applicati migration (Phase 4 round 30)
39	Low	Implemented (→ Fixed.md)	Feature	—	FIX-2026-05-19#43 — helix_code/applicati 29)

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
290	Critical	Fixed (→ Fixed.md)	Bug	—	HXC-114 — Wire facade (/v1/chat/completions) authentication — unauthenticated, paid-plan reachable on 0.0.0.0
291	High	Fixed (→ Fixed.md)	Bug	—	HXC-115 — The automated check that scans for hardcoded user-facing text stores its list of paths tied to one specific machine. On any new location those paths no longer match, so it fails as a brand-new violation and exits with a governance safety-net everywhere except where it stores the known-good list using paths relative to the check works anywhere. This restores real developer and automated run.
292	Medium	Completed (→ Fixed.md)	Task	—	HXC-116 — The multi-track development environment command-line tool both direct readers to exist in the repository. Anyone trying to build development tracks has no authoritative information with the shared storage drives. The task is covering the track layout, how to start track precautions. Operators can then run the new documented steps.
293	High	Fixed (→ Fixed.md)	Bug	—	HXC-117 — Governance rule CONST-040 requires capability a model supports be reported by the verifier rather than hardcoded. Today the verifier only supports embeddings; the other six capabilities are verifier-sourced but are not implemented. The verifier cannot truthfully tell users which models support which work adds these capability fields to the verifier product read them from there. Users then can read of-truth capability information.
294	High	Implemented (→ Fixed.md)	Feature	—	HXC-118 — A dedicated Retrieval-Augmented Generation maintained as its own reusable module, built to be imported or use it anywhere. A capability that answers (answering using retrieved documents) is added to end users despite the code existing. The RAG module into the application, wires it to the application, exposes its capability flag. Users gain working answers instead of an orphaned, unused
295	High		Feature	—	

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
		Implemented (→ Fixed.md)			HXC-119 — Governance rule CONST-040 is missing among required capabilities, but there is no mention anywhere in the codebase. Any user or integration with connectivity currently cannot use it. The work adds real ACP support, or, if it proves structurally sound, with cited evidence. The platform will then either hold an honest, evidenced position instead of
296	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-120 — A safety test for the web server that browser requests are answered with a page from the website to call the API. The server was configured with an explicit list of trusted sites, so the old test was based on expectation. The fix updates the test to verify that listed sites allowed, others refused) without error. The test suite now protects the secure behavior from an insecure one.
297	Medium	Completed (→ Fixed.md)	Task	—	HXC-121 — The code connecting the platform to Together AI model services shipped with a bug that a change could silently break how requests are handled and nothing would catch it. The work adds a test of client code against a simulated provider endpoint. For a request, the parsed reply, and error handling are now become protected against silent regression.
298	Medium	Completed (→ Fixed.md)	Task	—	HXC-122 — Two categories of tests, memory and automation, skip most of their cases by default. The server or special environment flags not set would skip these areas are largely unverified even though they are critical. The work provides a documented, repeatable infrastructure so they actually execute and verify. and automation behavior then becomes generally more than merely scaffolded.
299	Low	Completed (→ Fixed.md)	Task	—	HXC-123 — The command-line security-scanner tool has automated tests covering its behavior, so that a real scan produces wrong results. The work updates the core scanning and reporting logic. The scanner is now protected against silent breakage.
300	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-124 — One automated quality-assurance test for server workflows has a documented gap: the workflow token needed to finish the workflow end-to-end test does not meet the fully-automated no-human-intervention

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					work provides an automated way to obtain the workflow runs unattended. The QA build is automated and re-runnable.
301	Low	Completed (→ Fixed.md)	Task	—	HXC-125 — A large set of integration tests so an ordinary test run never compiles or executes. The signal is absent from routine checks. They are not so this is a visibility gap, not a broken feature. The standard test command or a documented test command status is always visible. Everyday test results show coverage.
302	Medium	Completed (→ Fixed.md)	Task	—	HXC-126 — Eleven work items marked finished in the issues document and are missing from the tracker. The two views disagree about their state and the work regenerates the tracker documents. The work so finished items appear only in the resolved tracker. The trackers then accurately reflect the true state.
303	Low	Completed (→ Fixed.md)	Task	—	HXC-127 — When an item is retired as obsolete, the recorded reason, date, and superseding replacement item is completely empty, including the item. This leaves retirements unexplained. The work populates the required justification details. The retired item carries an auditable reason.
304	Low	Completed (→ Fixed.md)	Task	—	HXC-128 — Thirty-six tracked items have less than the minimum length needed to convey what they are. The work cannot understand them without reading the full item. The work into clear plain-language descriptions explaining why it matters. Every item then becomes understandable to developers and stakeholders.
305	Low	Completed (→ Fixed.md)	Task	—	HXC-129 — Seventy-nine finished features are missing so risk-ordered validation and reporting cannot be done. The work backfills an appropriate severity and content and impact. Risk-based ordering and reporting correctly across the full item set.
306	Medium	Completed (→ Fixed.md)	Task	—	HXC-130 — A full build fails on a clean machine. The mobile graphical apps need system graphical dependencies that are neither installed nor documented. The work documents the build error with no guidance. The work documents the packages required, the command to install them, and the command to run them.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					graphics build path used for development. Anyone can then build the project or know without surprise failures.
307	Medium	Obsolete (→ Fixed.md)	Bug	—	HXC-131 — The client that talks to the Cognee completing its login and caching the access endpoint is never called and no bearer token calls would fail. This means memory features authenticate reliably. The work is to restore flow and prove it with the existing authentication access to Cognee-backed memory.
308	Medium	Completed (→ Fixed.md)	Task	—	HXC-132 — The full-infrastructure test starts a server container because its build recipe does not exist, and many memory and security because they look for a server on a fixed port override it. As a result a whole class of tests server. The work is to fix the container build URL configurable so those tests execute. This coverage of server-dependent features.
309	Low	Fixed (→ Fixed.md)	Bug	—	HXC-133 — One Azure-provider test quietly being present in the environment; when the test setup the test's assumptions no longer fragile and can give misleading results due. The work is to make the test hermetic (copy the sibling test already fixed. This makes it regardless of how it is run.
310	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-134 — The central model-verifier serial numeric value, while HelixCode expects that can break how verified models are managed is to align the two so the id is consistently identity keeps verification, listing, and state
311	Medium	Implemented (→ Fixed.md)	Feature	—	HXC-135 — HelixCode is now wired to read indicators (tool protocols, code intelligence) the central verifier, but the verifier's live reads those fields, so the flags always read as unknown the verifier publish these capability values users see accurate per-model capability in
312	Medium	Completed (→ Fixed.md)	Task	—	HXC-136 — Several mandated automated service, scaling, stress and chaos, and use

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					not exercised in the latest real-infrastructure is unconfirmed. The work is to run each of infrastructure and capture proof of the re-promised full test-type coverage and confidence load and adverse conditions.
313	Medium	Completed (→ Fixed.md)	Task	—	HXC-137 — The project depends on many health check of all of them (does each build tests) did not finish in the latest session. The health sweep and record the result for every whole codebase, not just the main application
314	Low	Completed (→ Fixed.md)	Task	—	HXC-138 — The end-to-end challenge runs scenarios (a missing option was just fixed) be executed against a live server with a real complete user journeys work. The work is challenges, capturing the results. This produces headline user workflows function end to
315	High	Fixed (→ Fixed.md)	Bug	—	HXC-139 — A vendored copy of a third-party Continue project) includes a Go source file not exist, and because that file has no separate swept into the helix_agent module's build checks for the whole module. This blocks the agent module. The work is to isolate the they are not compiled as part of our module (module marker). Developers regain a clear
316	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-140 — The quality-assurance module containing a lock (a mutex) instead of shared flags as unsafe and can cause subtle concurrency that loads real test banks is failing. The work value by reference (pointer) instead of copying the failing test-bank test. This makes the CI its tests green.
317	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-141 — The MCP module's Docker adapter error when asked to stop a container that doesn't exist, instead of returning cleanly. This causes a safe no-op. The work is to guard the stop container is handled gracefully. The adapter before-start and missing-container situations

		Fixed (→ Fixed.md)			HXC-142 — The automation-tagged test package for the mandated test type cannot execute at all. During the 2026-07-12 real-infra retest: a call to <code>isRateLimitError/contains</code> declared in both <code>bo</code> files) and deeper API drift where the tests use <code>and NewProviderManager</code> which no longer exists in the package. The work is to reconcile the automation provider API and remove the duplicate header. The tests runs against real infrastructure. Evidence: infra_retest_20260712_hxc122_138/autom
319	High	Fixed (→ Fixed.md)	Bug	—	HXC-143 — The e2e-tagged test package for <code>getEnvOrDefault</code> is declared more than once. The mandated test type cannot execute. The work is to consolidate declaration (consolidate to a single shared package) compiles and can run end-to-end against real infrastructure. the 2026-07-12 real-infra retest. Evidence: infra_retest_20260712_hxc122_138/EVIDE
320	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-144 — Under the sustained request-flood test, running server, the goroutine count grew to 4, signalling a goroutine leak in a request handler. server is hammered. Left unaddressed the test fails. stability under load. The work is to find the source of the unclosed channel, context, or connection. The goroutine count stays within tolerance under flood. Evidence: infra_retest_20260712_hxc122_138/EVIDE
321	Low	Fixed (→ Fixed.md)	Bug	—	HXC-145 — During the real-infra retest the test failed 2 of 5 because the model id configuration was rejected by the live Xiaomi API, indicating the config is stale or wrong. Users selecting the Xiaomi provider get errors. The work is to determine the correct config (from the provider or the verifier as single source of truth) configuration so Xiaomi requests succeed. Evidence: infra_retest_20260712_hxc122_138/EVIDE
322	Medium	Fixed (→ Fixed.md)	Task	—	HXC-146 — The e2e challenge runner advocates for <code>(cli, rest, tui, websocket)</code> but none of them are used to access the server's real HTTP API during a run, so the runner uses its own logic rather than the shipped logic. This is a documentation-versus-implementation gap. The work is to wire the challenge runner to use the real API.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					call the running server's HTTP API so the facing endpoints work. Discovered 2026-0 docs/qa/infra_retest_20260712_hxc122_13
323	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-147 — Running the (now-compilable the live OpenRouter API, TestAllFreeProv Provider_OpenRouter BasicGeneration pa dereference: the configured free model id rejected and the code path is missing a nil the response. Users of the OpenRouter free would hit the same crash. The work is to c id (sourced from the verifier as single sou nil-check so a rejected model degrades gr NOTE this environment has live provider spend real money; guard/skip accordingly
324	Low	Fixed (→ Fixed.md)	Task	—	HXC-148 — HXC-118 wired Retrieval-Augr native server generate and stream endpo compatible and Anthropic-compatible with completions and /v1/messages) still bypas those compatibility surfaces do not get re it is enabled. The work is to apply the sam those facade handlers so RAG behaves cor surface. This is a smaller secondary surfa fixed. Found during HXC-118 review 2026
325	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-149 — The main repository git index submodule gitlinks at pre-rename paths (HelixDevelopment/, <i>dependencies/vasic-di helix_qa/panoptic/security</i>) with no .gitmo historical path-rename to the submodules submodule status and git submodule fore submodule mapping found in .gitmodules maintenance script that walks all submod work is to remove ALL stale cached gitlin the submodule set is consistent with .gitm tooling completes. This is a git-index-only Found by the 2026-07-12 release-readines blocks release automation.
326	Low	Fixed (→ Fixed.md)	Bug	—	HXC-150 — The load/DDoS test harness (to TEST_PG_* and TEST_REDIS_* environme Postgres and Redis, but the projects .env.f

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					HELIX_DATABASE_* and HELIX_REDIS_*, the container credentials. So under the no workflow the suite falsely SKIPS even when ran once the correct credentials were passed (2026-07-12 retest). The work is to align the with .env.full-test so load/DDoS executes on harness only.
327	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-151 — Several regression tests in the RED_MODE switch whose job is to prove that it guards. In these cases the RED half checks that lives inside the test file itself, instead that copy is part of the test and never changes. The check produces the same result on even a working one, the broken one, and any future one and proves nothing about the product. The test reads a green result as evidence that the guard is in fact inert: the original defect could return green. The confirmed cases are handlers_preFixSystemStatusHealthCheck (a test-local preFixSystemStatusHealthCheck bypassed by construction), handlers_gast (hand-rolls the locking sequence in repro rather than calling the shipped handler, so library property), llm_rag_test.go (deliberately its retrieval step, so the ‘prompt was not a by the test’s own omission), and llm_work no RED branch at all, and another calls a touched). To reproduce: revert the matching test with RED_MODE=1; the branch still passes. Work is to rewrite each RED branch so it checks exactly as was done for the three sibling llm_default_model_regression_test.go and Done means that for every listed test, RED with only its own fix reverted and fails on a four-way result is captured as evidence, and enumerated search finds no remaining tests.
328	High	Fixed (→ Fixed.md)	Bug	—	HXC-152 — One test file in the server package the old bug’ mode and ‘confirm the fix works environment variable, but its default is unset — which is how the suite runs normally.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					— it selects the old-bug mode. The practice of confirming the fixed behaviour never executes, so the team sees a green report, but the fix is not actually verified. The behaviour left unguarded is that is supposed to hide models which fail a quality threshold, or have no API key configured. The anti-bluff filtering the original fix was written in the same file simply skips itself outright unless the provider key-gate is unguarded too. Every other package defaults the opposite way, so this fix misleads neighbours and will mislead anyone who relies on it. To reproduce: run the package normally and the assertions are never reached while both the old and new default is flipped so the fix-verifying assertions fail. reproduce-the-old-bug mode still works without the fix. captured evidence shows those assertions fail genuinely fail when the filtering is removed.
329	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-153 — A regression test in the server code proves the system-status endpoint behaviour. The test IS attached, but the test actually builds a session then only checks that the response code is 200. The test runs the same no-database case a neighbour has. In the database-present path it advertises has no database whatsoever. This matters because the name of the test deciding whether a behaviour is guarded is misleading. It would reasonably conclude the with-database case is not. It is the same documentation-versus-reality problem where a file's comment disagreed with its content. An independent reviewer of that batch. The test honestly defer coverage to another file, so the test is about the product — the defect is confined to the test means the test either is renamed to describe the defect or is given a fake-database seam so it earns the name. The choice backed by a captured run.
330	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-154 — A QA-session test checks that a session is the status 'pending', but the value it reads is 'running'. The test is racing to change to 'running' at that very moment. The JSON encoder the same live session object returns the response says 'pending' or 'running' depending on which goroutine wins, and under load or with the

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					worker can win. The result is a test that u fails for reasons unrelated to any real pro in the suite and trains readers to dismiss once during unrelated work, then passed race runs afterwards, so it is genuinely ra The underlying product behaviour is not may legitimately see either state — so the make the assertion accept either value or synchronised read instead. Done means t goroutine scheduling, proven by repeated with the reproduction captured first.
331	Low	Completed (→ Fixed.md)	Task	—	HXC-155 — The server package’s regression that flips them between reproducing an o return, but the switch is spelled four differ read through three different helper styles genuinely useful, because each guard cor fix and testers need to flip them one at a t the goal is not to collapse them into one v inconsistency has already caused real def its default set the wrong way round so its and another shipped with a comment des code did. Both were fixed, but the drift th work is to agree one naming pattern and every guard in the package, and record th the next guard author copies something c follows the documented pattern, every de direction, and a check exists that would c convention.
332	High	Fixed (→ Fixed.md)	Bug	—	HXC-156 — The Harmony OS desktop app system monitor that samples processor a seconds. To decide whether to keep going plain on/off marker, while the application very same marker off from a different ex coordinating the two. Two threads touchi moment with no coordination is a data ra missed entirely, leaving the monitor runn state after the application believes it has t machines the value read is not guarantee one. This was not theoretical; it surfaced a with the Harmony OS test suite failing on

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					run once race detection was enabled. To r test package with the Go race detector sw monitor loop and the cleanup routine as t same audit found a second, quieter instar same component: the measured processo power figures were written by the monito monitoring screen read them for display, which could paint a screen mixing numbe rounds. The fix makes the monitor stop o rest of the application already uses, prote status marker with a lock, and makes shu confirm it has genuinely finished before p Harmony OS test package completes with consecutive runs under the race detector, old code makes the identical race reappea not merely agreeable.
333	High	Fixed (→ Fixed.md)	Bug	—	HXC-157 — The Harmony OS and Aurora perform slow work in the background — answer, polling provider health, refreshin the server — and each of those backgrou straight into an on-screen element. The us uses does not permit that: on-screen elem the single thread that draws them, and ar update over to be applied there. Doing it c can be reading an element at the exact m rewrites it, which is a data race that can c crash the application outright. The proble hidden: in both applications the offending comment stating ‘Update UI on main thre it is the identical false comment already r end when this same defect class was fixe factors were found by auditing every back rather than only the reported line: severa screen elements to decide what to do, whi them, and several ran on endless timers v modifying elements belonging to a windo and leaked for the lifetime of the process. through the shared dispatch helper intro keeps each read-and-then-write pair insid cannot be left behind, moves the reads th

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					the drawing thread where they belong, co place so a later edit is not invited to undo makes the endless timers stop when the a Acceptance: both packages build and pass over repeated runs, no background work screen element without going through the end's behaviour is unchanged.
334	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-158 — The Harmony OS and Aurora corrected so that background workers no elements directly. That correction is, how evidence. No test in either package ever c screens, so the background workers that p while the tests run, and the race detector opportunity to observe the very code path running the Aurora OS package under the races both before and after the fix — not l but because nothing under test reaches it failure that was reproduced and fixed can the background system monitor, which te that a future edit could silently reintrodu a background worker in either file and ev exactly the situation the anti-bluff policy suite would then be certifying behaviour Closing this requires a test that builds the the chat worker, the provider-health polle resource timers — with the race detector observation rather than by inspection, tog variant proving the new test genuinely fa back. Acceptance: a test in each package s background workers against real widgets repeated runs, and demonstrably fails wh removed from any one of those sites. Unti specific sites should be described as review
335	—	Completed (→ Fixed.md)	Task	—	HXC-160 — The project's agent manuals — CLAUDE.md, AGENTS.md, QWEN.md, GEM repository root, their copies under helix_ and the cascaded copies inside the format submodules — still tell every reader that docs/Fixed_Summary.md are produced by generate_issues_summary.sh and scripts/g

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					has not been true since the workable-items single source of truth: both summaries are database by the constitution submodule's scripts derive them from the Markdown table drops every item recorded as a heading section. The practical harm is that an agent doing destroys tracked state: on 2026-07-29 a had closed-item tally from 344 to 188, corrupted replaced the full per-item table with aggregate caught it. The scripts themselves have run, so the immediate danger is closed, but so every new agent is still given the wrong refusal only by tripping over it. Fixing this and section 11.4.91 anchor text in every carrier exporter as the generator, which spans root copies inside submodules that other reports five carriers in lockstep per section 11.4.1 engineer who reads a manual to learn how summary, and everyone relying on those state. Reproduce by opening any listed manual generate_fixed_summary.sh — the surrounding current generator with no mention of super carrier names the DB exporter, no carrier current, the five root carriers stay in lockstep would fail if a manual reintroduced the state
336	—	Fixed (→ Fixed.md)	Bug	—	HXC-161 — The guard at scripts/gates/fixe checks that every closed item written in d also appears as a row in that file's summary failures, and it was already failing before are reproducible against the last commit standing red gate rather than something a is a change in how the file is produced. The the workable-items database, and the data which single surface form it takes: some i and others as detail sections, never both. when the table was maintained by hand a appear in both places, so it is now asserting deliberately no longer provides. Two outcomes not be guessed between: either the guard to assert what the generator actually guar

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					genuinely dropping rows that ought to be caught, catching real data loss. Deciding which representation handling and confirming a deliberately not resolved here — weakening without that investigation is exactly the same forbids. Who benefits: anyone relying on vanishing from the closed-items summary was created to prevent after one item was by running bash scripts/gates/fixed_h2_pi repository root and observing 58 failures and HXC-119. Acceptance: the correct branch evidence, the guard passes for the right reason softened, its paired mutation still makes it broken, and if the generator was at fault to
337	—	Fixed (→ Fixed.md)	Bug	—	HXC-162 — When a user types a request in a command-line client, the feature that is supposed to match a known skill and run it automatically decides which skill applies is created correctly but discarded without ever being connected to what the user types. To the user this looks like the skill does not exist in the CLI, even though the skill is present, correct and documented. This makes the product is meant to turn a plain-language request into the user learning any commands. Anyone can reasonably conclude the feature is implemented but unnoticed. The fix is to connect the dispatcher input is handled, and prove it with a test that the skill actually runs. Reported in SOURCE-layer inspection; still needs runtime
338	—	Fixed (→ Fixed.md)	Bug	—	HXC-163 — The project ships seven ready-made shared governance components and are meant to be used by a project that uses it. In practice none of the components are running in the system, so not one of them can be used as an agent. The effect is that work the organisation maintains sits unused, and each project that needs skills already solve. Separately, one entry in the storage location that only exists on a Mac, is a broken link that resolves to nothing. These entries in the catalogue looks populated from the outside. Closing this means registering the seven s

					mechanism, repairing or removing the br that fails if a shipped skill is present on di
339	—	Fixed (→ Fixed.md)	Bug	—	HXC-165 — One of the performance stress over a reference file that is stored in versi The reference file is supposed to be the fix measurements are compared against, so c yardstick silently becomes whatever the n most recently. That destroys the comparis on a busy shared machine the numbers a also leaves the project permanently show trains everyone to ignore that signal and corrupted baseline likely. A reviewer had committing it during unrelated work. The location that is not version controlled and read-only.
340	High	Fixed (→ Fixed.md)	Bug	—	HXC-167 — Before a recorded test conver cleanup step is supposed to remove any s cleanup has two weaknesses. First, it can script itself already knew about, so anyth back to us — a session cookie, a returned is unknown to the cleanup and is saved ex that kind has actually leaked so far, becau happen to return one, but the protection s worse, the cleanup can fail silently: the se replacement tool in a way that treats cert so a secret containing one of those charac failure is deliberately discarded rather th that stays in the file with no warning to a replacement treat secrets as plain text, m silent, and add a scan of the finished file t remote side sent us.
341	Critical	Fixed (→ Fixed.md)	Bug	—	HXC-169 — The agent can run user-suppli container for safety, and it drives that cor library. Four publicly documented flaws i parts we use — in particular the file copy- and for three of them the vendor has pub so there is nothing to upgrade to. We conf affected operations rather than merely sh analysis traced the calls from our own sar

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					functions. This matters because the flaws onto the machine that hosts it, which is th exists to prevent. What remains unknown whether an outsider can actually influence way we deploy them, and whether this sa real deployments at all. The expected out by evidence: either a demonstration that in our configuration, or a concrete contain the feature, constraining the copy paths, c container service. Because no upgrade ca decision is the only way to resolve them.
342	High	Completed (→ Fixed.md)	Task	—	HXC-170 — Eight of the agent’s supporting that fix known weaknesses, and every one bug-fix-level release within the same major authors are committing to not breaking h they close eleven of the eighteen known v compiled program, including four we hav genuinely reaches during normal operati single highest-value change available: a s bumps that measurably shrinks our expo anything. One of the eight also fixes a text automated safety checks route untrusted no advisory service had flagged at all. Eve on the agent benefits, and the reviewer b enough to actually read. The expected out project rebuilt, its tests run, and a fresh s weaknesses no longer appear, with the be as evidence. Two of the eight are minor r deserve a slightly closer look at build and
343	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-173 — One of the tests that checks th its on-screen values safely will report a fa it is under heavy load, and passes cleanly underlying feature is fine — this was conf in isolation, where it passes — so the failu defect in the product. This still matters, b unrelated to the code teaches everyone to time it fails for a real reason nobody will problem for release preparation, where t many other jobs are active. The fix is to m condition it cares about rather than assur

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					a fixed window, so that a slow machine produces a false failure.
344	High	Fixed (→ Fixed.md)	Bug	—	HXC-174 — The text-based terminal interface for assurance sessions and their progress. It records the shared session objects at the moment the session ends. A background worker is simultaneously updating the session. Nothing coordinates the two, so the screen can be out of sync. The sharpest case is the elapsed-time display: the time has been recorded and then immediately updated. In the next two steps the background worker may still be using a value that is not fully there yet. In practice, this causes briefly nonsensical timings, and on an unresponsive interface. This is not new and was not intentional. Now the only place in the project that ignores the state of the code follows and that the session code does not take a consistent copy of each session value before updating the screen from that copy.
345	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-176 — The shared governance component creates a shortcut that points at wherever the installer sits on the machine doing the install. Because it points to a specific location rather than a location relative to the user, it only works on the computer that created it. This is a bug broken in this project: it had been created on a Windows external drive, so on this Linux machine it never had. It had never once worked here. That single bug was never repaired, but the installer that produced it was replaced. It recreates the same problem. A guard now prevents this. It is a safety net rather than a cure. The project's next component: record the location relative to the user. It works on every machine that checks the path.
346	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-177 — One of the skills shipped with the system is a blank placeholder in a form the system does not only substitutes placeholders written in on the screen but never replaced. The consequence is that the system sends onward to the AI model as part of the request a string of meaningless noise rather than as the value of the skill. The user sees a lower-quality answer with more noise. Found while working on unrelated skill work. The fix is to correct the placeholder.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					add a check that refuses to ship a skill cor cannot resolve, so the same mistake cann
347	High	Fixed (→ Fixed.md)	Bug	—	HXC-182 — The file that records the refer measurements are compared against has and now holds this machine's numbers in not been committed, so the correct values project history and can be restored with c many people and automated helpers wor at once, and any of them running a comm once would sweep the corrupted file in pe reference would silently become a busy s later comparison against it would be mea warning. The underlying cause is being fi stop writing the file, but that fix does not present. This needs the file restored now, everyone working in this copy rather than message where no one will see it.
348	High	Fixed (→ Fixed.md)	Bug	—	HXC-183 — When the product streams a r background worker hands results back to caller gives up early — the user cancels, o must notice and stop. Six providers were and each got a test proving it. One provid results back without checking whether an worker blocks forever and both it and its never released. Every cancelled request a more of the machine's capacity until the s mechanical, because the correct pattern a and there is a shared test harness it can b independent review noticing that the rou short of covering every affected provider.
349	Critical	Fixed (→ Fixed.md)	Bug	—	HXC-184 — A recent change made the con pipes to close rather than for the comman normally the same moment, but not when running in the background: the backgrou so the wait never ended. The request hun consumed one of a small fixed number of commands stopped the facility accepting ROUNDS. Round one added a bounded gr reaped, then stopped reading and release

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					review accepted the mechanism but found somewhere unmeasured: an adversarial process command with no background process at following the documented pattern, delivered previous code delivered all 5000. The original the consumer kept pace, not when the open Round two replaced the fixed grace with a restarts whenever a line was actually handled window in which nothing at all was delivered then tested an objection the review had not revive the original hang — and showed it requires a consumer that is still listening; consuming within two windows by construction remains genuinely unbounded is a caller a background process that keeps producing than hidden, because cutting it off would reading. Three smaller findings were also the truncation flag from a recorded error branch ran, so no scheduling coincidence
350	High	Fixed (→ Fixed.md)	Bug	—	HXC-185 — Modern internet addresses combined with a port number it has to be result is unreadable to the software that recently corrected to do this properly. A replaces that build addresses the same unsafe address from configuration or from service illustration sits inside a single file that checks ways: the connection check carefully adds the web-request check a few lines away from same service. The others cover the local notification service, worker connection Each is a one-line change using the standard correctly. Left alone, any deployment using confusing partial failures where some checks the same healthy service.
351	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-186 — Every shipped change must call and a check enforces that by looking for the evidence files. The evidence files also auto project's current position was at the moment stamp is an identifier of exactly the kind of evidence file written while the project had

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					change can, purely by coincidence, be accepted even though it demonstrates something correct yet happened, because every recording satisfied at a position that requires no evidence to every recording the shared tooling process check accept only identifiers deliberately for, ignoring the incidental position stamp tightening the rule may withdraw acceptance recorded, so it is a deliberate decision rather
352	High	Fixed (→ Fixed.md)	Bug	—	HXC-187 — The project declares the same once at the top level and once for the real that, one particular internal name refers pieces of code — a five-line placeholder a kilobyte subsystem inside. They share no piece of code actually receives depends on build was started from, which is not something expect or notice. Nothing is broken today placeholder has no users, but that is luck until time someone adds one the behaviour with the same source with no error to explain module a distinct identity so the collision placeholder is a separate decision and is correct this.
353	High	Fixed (→ Fixed.md)	Bug	—	HXC-193 — One of the small services we serve health check that asks a web address on a service is alive. Three facts combine to make reads no configuration from its environment supposed to tell it which port to listen on. It never listens on the port the container publishes that same port. So the check queries an address answer, and reports the container unhealthy service is actually working. Anything that containers will do so endlessly. This was from unrelated security advisories in the same because it means nobody had exercised the written.
354	High	Fixed (→ Fixed.md)	Bug	—	HXC-194 — One of our own small services rather than using the toolkit that ships with doing so it tells every browser that any web

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					to it, and it never checks who is asking. A by someone on the same machine or network service and read its responses. This is the advisory describes for the library's own to rolled our version instead of using theirs, fix ours — the advisory and our defect are look alike. That distinction matters, because make the warning disappear while leaving to check the origin of incoming requests and reject anything else.
355	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-195 — The container definition for o intended to tell the service which network reads any settings from its environment, s The result is a setting that looks like confi container definition where anyone would has no effect — so a person adjusting it to change and no error, and would have no v cascades: the published port and the decl written to match that inert setting, so neit service actually does. Either the service sh setting should be removed and the real be inert knob in place is the worst of the thre
356	High	Fixed (→ Fixed.md)	Bug	—	HXC-198 — A serious defect was recently that leaves a background process behind permanently consume one of a small num function in the very same file, used for co while they run, has the identical defect an output readers to finish before waiting fo time limit and no give-up path, so the sam open indefinitely. The route that runs com reaches this function, so the hang is reach time in one working cycle that a correct fi not to its sibling a few lines away, which s routinely ask what else in the same file sh already exists and is proven next door, so rather than designing anything.
357	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-199 — A recent change gave one par that two different pieces of code could sto diagnostic script that checks whether that

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					the old name as a fragment of text, and then as a prefix — so the check still matches and is unfixed even though it is fixed. Anyone reworking that is already done, and might undo what worked. The project handbook also still does in three places. The fix is to make the check more than a fragment, and to update the handbook so the code actually does now.
358	High	Fixed (→ Fixed.md)	Bug	—	HXC-201 — The command the project’s manual tracker documents does not put them where one directory and is told to write output to the root, but the build step also changes the work lands inside the tool’s own folder instead. It destinations and reports success, leaving the and several hours stale, and it creates empty wrong location. This replaced an earlier version that was outright invalid and failed loudly. The visible error became a silent one. It also error previously found in that folder and attributed. The correction is to give an absolute output path output against the project root regardless of to update the manuals and the check that form.
359	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-202 — A recent change taught the project modern internet addresses when combining was applied where the server decides where the desktop application for one platform then connects to from the very same two configurations address configured, the server starts up and constructs an unusable address and cannot like the server is down when it is running exists in a maintenance tool that contacts is newly broken; both were simply outside change examined, so nothing was made with one working cycle that a correct change was to a sibling doing the same thing nearby, with review habit rather than seven separate changes
360	Critical	Fixed (→ Fixed.md)	Bug	—	HXC-203 — The component that tracks location offers a method to report their status. Des

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					also writes to the shared records it reports provider's health and stamps a last-check coordinates those writes, and the component so two callers asking at the same moment caught by the race detector during a full t false alarms, so it is a real defect rather th further problems compound it: the method collection itself instead of a copy, so every can also modify; and the health check tha network calls while holding no lock, so slo the window. The consequence for a user i healthy provider as unhealthy or the reve corrupted records shared across the whole protect the shared records with a lock, re collection, and separate the act of refresh reporting it.
361	Critical	Fixed (→ Fixed.md)	Bug	—	HXC-205 — A sibling component that man model providers has the same defect just additional twist: this one actually declares then writes provider health, process hand three other places without holding it. Tha no lock at all, because a reader of the code reasonably assumes it is applied througho as the defect already fixed next door — co overwrite each other, and a provider can stopped or stopped when it is running. Th same pattern after fixing the first one, and working cycle that a defect has had an un the same shape as the one already proven writes only, never across process start, pr
362	—	Fixed (→ Fixed.md)	Bug	—	HXC-209 — The shell tool validates each c policy before running it, and does so on a The background path does not call that ch chooses background execution with an or tool, anyone able to request a shell comm in the background, and in doing so step a allowlist. The protection is therefore not r absent, while the tool presents the same i that a different and unguarded route was fixing an unrelated hang in the same func

368	—	Fixed (→ Fixed.md)	Bug	—	HXC-215 — The gate that checks whether be built reported a failure on two separat commit each time, and in both cases the r when the gate's own command is re-run a packages it reported as broken were unre commits changed, which was the first clu these were real non-zero results at the mo a run that was cut short. What distinguish a reproduction is that it builds five comm throwaway checkout, all of them sharing reproduction builds one. That points at in consecutive builds rather than at any defe though the precise mechanism is not yet p assumed. This matters more than an occa because the gate blocks releases: a check teaches people to dismiss it, and the day i broken commit that habit will let the brea make the gate produce the same verdict e input, and to prove that by running it rep tree.
369	Low	Fixed (→ Fixed.md)	Bug	—	HXC-217 — When an item is closed, the re hold the location of the captured proof, so it and so that a machine can confirm the p closures that field instead contains a para proved. The descriptions are substantive underlying evidence does exist elsewhere missing and no closure is unfounded. The be verified mechanically: a check that ask something real will report them as pointi indistinguishable from a closure with no ambiguity is the defect, and it matters bec well-documented closure from an empty about the wrong one. The work is to move description where it belongs, put the actu and add a check that refuses a closure wh resolve.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
370	High	Fixed (→ Fixed.md)	Bug	—	HXC-218 — When the security scanning tool supports supporting services, it checks whether each has a network address from a host and a port that it works, but modern IPv6 addresses contain a colon and must be wrapped in square brackets before being used in container code does not do that wrapping and the build is malformed and the health check fails on the machine. A companion fix already repaired the issue. START goes through a different path in the code that was not covered, which means operators are confused for what looks like no reason. The obvious fix is that address is unsafe, because another part of the code uses raw unwrapped form when deciding whether to wrap wrapping it would silently break that check. The proper fix is that operators running on IPv6 should use the scanner normally instead of hitting a special path means the start command completes its health check exactly as it does on an IPv4 one.
371	High	Completed (→ Fixed.md)	Task	—	HXC-220 — A diagnostic script used to report on a test that shared the same module name, when in fact it was that it looked for the shorter name in the code. Comparing the two names as wholes, so a difference between them different was still reported as a class. The script was corrected and behaves properly today, but the test was never added to keep it correct. That means the check is easy to rewrite carelessly during a refactor. A comparison came back nobody would not have noticed an engineer that finished work was unfinished. The correct change. The project requires every test to be a standing test that fails if the defect returns. The test is still missing here. The people who benefit from the diagnostic to tell them the true state of the system. The registered test exists that passes on the current code. The loose name matching is ever reintroduced.
372	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-221 — The agent component issues a key to the service. It builds each key from sixteen bytes of randomness, which is correct. But if the service fails to answer, the code does not stop — it keeps reading the clock reading and hands back a key derived from the same made that way is guessable by anyone who

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					issued, and the caller receiving it is told no key and is accepted as one. The function is to its caller, so the ability to refuse safely of likelihood of the randomness source failing this has gone unnoticed, but the consequence starts issuing predictable credentials with wrong. Failing loudly is the correct behavior an error can retry or abort, whereas a call no way to know it must. The fix is to return reading, and to add a test that forces the n confirms no key is produced.
373	Low	Fixed (→ Fixed.md)	Bug	—	HXC-222 — The agent component has two party libraries committed into version control toolkit and 1,037 under its plugin service, These are not our code. They are fetched from registry using the manifest files that sit below one of them can be recreated on demand stored. Committing them makes every clone larger and makes it hard to see our own code any routine dependency update rewrites project already has a rule against version mechanism can regenerate, and the ignore folders, so nothing prevented them from tracking both folders, add them to the ignore documented install step still reproduces the — the last part matters, because removing recreation path is proven to work.
374	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-223 — Before every commit, a check for markers left behind by a deliberate sabotage where a working safeguard is temporarily notices. Leaving such a marker in real code blocking it is correct. But the same experiment it did, and that record necessarily quotes its proof. The check cannot tell the difference broken and a written account of code that so it refuses the account. The two rules the one demands the proof be captured, the other This is not hypothetical — it happened too left out of its own commit, which is exactly quietly goes missing. The fix is to teach the

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					markers inside a recorded transcript und description of past work, while the same hazard. The check must keep refusing the first, and must be tested against both so it everything or accepting everything.
375	Medium	Obsolete (→ Fixed.md)	Task	—	HXC-225 — A single bundled helper comp responsible for 140 of the roughly 208 sec the whole project — about two thirds of th codebase without ever being discussed. N does, whether we wrote it or copied it in, actually uses it, or whether removing it w questions are answered the headline advi as though the agent project carries enorm great bulk of it sits in one component that we deliver. The work is to determine the c whether it is reachable from anything we decision about it — keep and maintain, up remove it — and record which was chose more than the individual advisories, beca inside a component we do not need would
376	—	Fixed (→ Fixed.md)	Bug	—	HXC-228 — When the whole system is sta checks its four mandatory dependencies a the fourth, the knowledge-graph compone treats that as fatal, prints a boot-blocked m start the dependencies by hand, and exits supervisor then restarts it fifteen seconds knowledge-graph component has finishe succeeds. The end state looks healthy, so t but every cold boot produces a genuine cr log, and fifteen seconds during which the is that the service unit does not declare th knowledge-graph component, so the super same moment and the race is decided by instruction the service prints when it fails operator to start the dependencies manua starting and simply have not finished. The the supervisor waits, and to make the dep component that is still coming up rather t permanent absence.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
377	—	Fixed (→ Fixed.md)	Bug	—	HXC-229 — The multi-provider routing gateway framework's debug mode rather than release mode is the startup log alongside the framework's warning log. Debug mode is switched for production use. Debug mode prints every registered route at startup, prints every log on every request, and in this framework is unsuitable for production because of the detail it exposes in error responses. The system supervisor as a long-running background process in the production case the warning is about. requests failing, which is why this has gone into production. deployment is currently logging at development level more internal structure than it should. To correct it, an environment variable or a config file in the service unit is the natural place to set the mode. In release mode when the service runs under the system supervisor check that fails if a production unit ever switches to debug mode.
378	—	Obsolete (→ Fixed.md)	Bug	—	HXC-230 — Every time the Helix platform starts, the HelixAgent service crashes on its first attempt to connect on the automatic retry about sixteen seconds later. The problem: the infrastructure service reports that the container engine has been asked to create a container. The Cognee knowledge-graph container needs to be able to actually answer requests. HelixAgent reports that the Cognee, is refused, treats the refusal as a failure. Systemd then restarts it and the second attempt fails. The problem is that a restart of the platform always logs a warning, a permanent restart count against the service, and the problem is harder to spot; and if Cognee were ever slow to start, the platform would stay down instead of restarting. 2026-08-06: a full stop and start of the platform. The failure seen in an earlier run from 2026-08-06: the infrastructure service wait for its container to be created, reporting success, rather than reporting success when the container is created.
379	—	Fixed (→ Fixed.md)	Bug	—	HXC-233 — When the HelixLLM gateway starts, the local model server program called llama-server cannot be found. Searching the path for the program is worse than a misconfigured search path: the program is anywhere on the host, so this is not something that can be fixed by a config file.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					pointing the service at the right directory, as a warning and carries on without it, so local model serving feature is absent for t is particularly wasteful because the gateway minutes downloading a large model file s serve it; the download succeeded and the Observed live on 2026-08-06 during a full requires actually obtaining and installing the service can find it; it also raises the qu should be downloading models at all whe consume them is not present.
380	High	Fixed (→ Fixed.md)	Bug	—	HXC-237 — The command the project uses records, workable-items validate, runs from was last rebuilt on 27 July. A new safety check 6 August: it refuses any closed item whose actually lead to a real file. Because the project that check is simply not present in the project the source code containing it looks correct running both against the same deliberately with everything else held identical: the project everything fine and exited successfully, the correctly found and described the bad record. This matters because the checker is the the unproven work from being marked finished using it since 6 August carries less assurance means the ticket that introduced the checker. The fix is to rebuild the program file, published when the built copy is older than its source
381	High	Fixed (→ Fixed.md)	Bug	—	HXC-244 — The gateway is the service even talks to when it needs an AI model, and it automated systems and on-call staff poll the address always answered “healthy” with a and it would have answered exactly that underneath. The cause was a single missing collects health verdicts was created and had was ever registered with it to check, so it answered and “healthy” was the only verdict it could cache, the vector store, the model verifier all have been dead and this address would fine. This matters more than a plainly mis

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					with no health address is an honest gap e one that asserts a state it never verified w deciding where to send traffic, by supervi and by whoever gets woken at night. The outcome achieved is t names the four dependencies it checked a really took, and a standing guard fails wh so the endpoint can no longer claim a ver
382	Critical	Fixed (→ Fixed.md)	Bug	—	HXC-249 — The script the project runs to reporting success on tests that never actu agent runtime and then waits for it to ans waited at the wrong address - the one a d verifier, happens to occupy. The verifier p anything it does not recognise, and the wa at all as proof the agent was ready, so the up without ever having reached it. The te the agent at that same wrong address, cou excused themselves rather than failing - a failures, the whole run finished with the r passed” having validated nothing. This m problem found in the same session, becau that could mislead, while this one is the m decides a release is good, and it was alrea on this machine with nothing special don on a green validation run before shipping being told the system had been checked w readiness check confirm the identity of w that something answered, points the tests actually bound, tells them that in this spe is a real failure rather than an acceptable executed zero tests fail outright. The expe from this script means the tests genuinely and a run that validates nothing can no lo
383	High	Fixed (→ Fixed.md)	Bug	—	HXC-250 — When a user asks the system t configuration file for their command-line

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					produces points that assistant at the wrong network address that belongs to the mode agent runtime the assistant is supposed to requests to a component that does not un “not found” in reply. From the user’s point does not work, with nothing in the error e their brand-new config was wrong from t forty-eight assistants the project document affected; a fix landed earlier covers only t generator that serves all the rest still writ is the most directly user-facing defect in t an internal test that misleads a developer an instruction to use it. The people harme feature exists to help: someone setting up following the documented path, and getti way to diagnose. The expected outcome is configuration names the address the agen all forty-eight documented assistants are that a generated config works when the u setup without editing anything by hand.
384	High	Fixed (→ Fixed.md)	Bug	—	HXC-252 — The automated check that gua against drift gives the wrong repair instru and following that instruction would destr same information in two places: a databa copy, and a set of human-readable docum check notices the two disagree, it tells the documents into the database - which is ex database is the side that is meant to be tru side that is meant to be regenerated. At th found, obeying the message would have o forty-six items with a stale document hold items outright and resurrecting eight that trap is particularly dangerous because it f already worried about consistency and is exactly what the tool tells them. Anyone r records is at risk, and because the loss wo synchronisation rather than an accident, long time. The expected outcome is that th direction - regenerate the documents from

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					the tool's own advice repairs the disagree loss.
385	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-253 — Three automated safety checks prevented specific problems from coming back, and they never ran them. Checks like these are the norm, but the problem is prevented from silently returning to a particular behaviour and complains if it happens. The checking system has no automatic discovery, so it runs if some other script explicitly calls it, but it was never named anywhere. They had therefore been looking like protection while providing no real protection. It had been formally closed on the strength of a check that was executed a single time. This is a quietly serious flaw that makes the project's safety net appear largely illusory. In the present, discoverable by anyone browsing the code, it provides coverage, while doing nothing. Everyone who relies on the regression protection benefits from closing this issue. A check that exists and a check that runs independently are not the same. The three are now called explicitly by the test suite, and each was first proven able to fail before being replaced by a check that merely always passes. The hope is that the sweep is started by a person rather than a script. The checks now run whenever someone runs the test suite, an improvement but is not the same as unattended testing.
386	Critical	Fixed (→ Fixed.md)	Bug	—	HXC-261 — The challenge script that is supposed to verify the gRPC protocol works was structurally incorrect. It was reporting green for the entire time it has been running, compounded. First, it resolved its port from the environment, named HELIXAGENT_GRPC_PORT, defaulting to 50051, but that no Go source reads (the server honours the environment and a number belonging to no service in the registry, hardcoded 50051, not the registry's 8112, and far worse, every one of its four probes was wrong: whether the port answered or not: the probe was true when the port was listening AND received a response when it was not; the unary-call, streaming-call, and unary-watch did the same. The two faults together meant that no HelixAgent process has ever been able to pass the test, then certified the gRPC protocol healthy. This is a serious defect in the codebase because it is not merely a false positive.

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					an automated test actively producing false results, what the anti-bluff covenant exists to prevent breakage from everyone reading the suite, the framework's own documented contract: the record_skip helper whose docstring says not to use with status true to mask a missing feature, not used. This item covers resolving the port variable name and default, consolidating the guard into one helper so absence is interpreted as an absence report as an honest SKIP carrying success, making a real failed call report as a state final verdict (which reported PASSED including when nothing had been verified), reports SKIPPED when no assertion could be guarded at challenges/scripts/tests/protocol_ with RED_MODE=1 against the pre-fix script to prove it is free, drives the challenge's own confirms assertions are recorded PASSED that same guard with RED_MODE=0 reports against a proven-free port with every port and the challenge still records a genuine listening gRPC server is listening on the registry port
387	High	Fixed (→ Fixed.md)	Bug	—	HXC-269 — When the model verifier builds a port, and the host value contains a question mark, the port is silently swallowed and the address is the port instead of the one configured. WHY IT HAPPENS: the port is appended after whatever it was given, and the string produces something like a normal address at the end of the query rather than onto the query. HOW TO FIX: the parser then reads the host correctly, reads the port digits as part of the query text. HOW TO TEST: connects to the wrong place with no error message, which is the same silent-misdirection this item aims to eliminate. WHY IT IS REACHABLE RATHER THAN NOT: the host-normalising step accepts these shapes, and the flows end to end from the operator-facing configuration with nothing reporting a problem. CONFIRMED BY MEASUREMENT: a host with a question mark into the query; a host with a fragment lost into the query; a host with a path loses it into the path. WHO IS RESPONSIBLE: the model verifier

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					pastes a full address into the host setting instead of the address setting, which the component's own logic would likely mistake. HOW TO REPRODUCE: build a query containing a question mark and any port, then observe the port is empty while the query is processed. CRITERIA: a host containing a query, fragment, or port with a clear message naming the setting as not being handled so the port survives; whichever is the case rather than left with a silently wrong address. This is all three shapes plus the ordinary host and a paired mutation that removes the handling.
388	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-270 — HelixQA copies failed reply bodies into error messages in several places, and one of these is exactly where a credential is most likely to appear when a request returns an unsuccessful status. The reply body as the description of a reported error is on sites in the same validation routine — the sign-in path, and the media-search path. A fourth error is a shared HTTP helper: an error message caught by a wrapper around the underlying decoding logic. The toolchain quotes a character taken from the error message in these reports and errors are written to show the error in automation, so anything the server put in the error message is in them. The sign-in site is the highest risk because it is an endpoint that echoes a submitted token, and the error message includes an authorization header in its description. The value copied verbatim into a durable record is the error message tested service's own error bodies, which is a mechanical risk. RELATIONSHIP TO OTHER FINDINGS: we hardened the SUCCESSFUL sign-in path so that the error body byte count and a decode position, never a failure, and the component now redacts values that look like credentials. Sites predate that work and were deliberately not under review, so the discipline is now in place. The success path is careful and the failure path is not. HOW TO REPRODUCE: point the pipeline to a host that returns an unsuccessful status with a message containing a recognisable marker, run the validation script, and the marker appears in the recorded finding and in the error message. ACCEPTANCE CRITERIA: none of the five sites

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					report the same class of bounded, non-echo already uses; the decode-complaint wraps and a shape rather than a quoted character marker placed in a failure body never appears any of the five sites, proven real by a pair of echo and makes the test fail.
389	Critical	Fixed (→ Fixed.md)	Bug	—	HXC-271 — One of the two families of remote cannot ever succeed, on any machine, how BROKEN: the facade family of calls — the streaming a completion, and chatting — never always handed an EMPTY list of providers immediately when the list is empty. So even same failure regardless of how many providers and discovered. WHY IT IS NOT A CONFIGURATION serving this family was never given a reference the discovered providers; it has no such first registry into the OTHER family only, and the call does consult it, which is why the two families despite looking equivalent from outside. It was captured at runtime on a machine where it genuinely been discovered from live providers on an unprovisioned host — the providers expect a message saying no providers were configured client using the facade family, which is the presents first and the one an integrator would MANIFESTS: a caller gets an error advising the registry for credential injection, which reaches their side and sends them to check credentials ACCEPTANCE CRITERIA: the facade family succeeds against configured providers, on the published interface with a clear error name drives each of the three calls end to end and asserts a genuine response rather than a paired mutation that removes the registry
390	Medium	Fixed (→ Fixed.md)	Bug	—	HXC-278 — The routine that pulls an account three ways to fail, and two of them have no still copies part of the reply into durable memory when the reply arrives successfully AND presents a recognisable token, the routine lists every item that list into the returned error, into a reply

#	Level	Status	Type	Fixed-In Tag(s)	One-line description
					session log. WHY THAT IS A RISK: the reason was that field names are safe because the it, which is usually true — but the names actually answered, so a request that lands service that returns diagnostic material u material straight into a record we keep an WORSE THAN IT LOOKS: the list has no li names are included nor on how long any oddly beside a bound the very same area reply data for exactly this concern. WHO archived report, and anyone pointing the misconfigured service, which is precisely token reply in the first place. RELATIONSH third distinct failure route out of one rout case where the reply could not be parsed, the reply was rejected or failed to decode, pointed at; this is the one nobody asked a checking whether a marker planted as a f could still come back out. It can. HOW TO step at a service that answers successfully containing a recognisable marker as one then observe the marker in the returned the session log. ACCEPTANCE CRITERIA: t useful — a count of fields, and names only safe — while any name resembling sensit whole list is bounded in both count and in the bound already applied nearby; and a directions, that a marker planted as a field error; finding or log line, while an ordinary real by a paired mutation restoring the ra entirely.
391	—	Fixed (→ Fixed.md)	Bug	—	HXL-001 — HelixLLM internal/agents hardcoded absolute path
392	—	Fixed (→ Fixed.md)	Bug	—	HXL-001 — HXL-001 (ex-ISSUE-003): Helix path
